

## Section 3

Workplace Inspections

Occupational Health & Safety Manual 2020

### WORKPLACE INSPECTIONS

A workplace inspection is a physical tour of the worksite that helps determine if hazard controls are in place and working and identifies any new hazards that may have been introduced to the worksite.

Planned inspections do not replace informal daily inspections and the hazard reporting process that should already be in place at the worksite. Inspections need to occur on a regular basis and are most effective when they involve all the staff. We are all responsible for conducting informal inspections of our work areas on a daily basis as well as participating in formal inspections.

Formal inspections of all areas of the worksite must occur at least once a year and higher risk locations such as science, CTS and mechanical areas should occur at least twice annually. Templates are available to assist in the formal workplace inspections practice (see appendices for templates). Training is provided in workplace inspections by each school Occupational Health and Safety representative and/or the district Occupational Health and Safety Coordinator.

Ongoing inspections of the workplace provide important information about unsafe conditions or potential hazards that have not been identified before. These planned inspections help verify that controls to eliminate or reduce risks of known hazards are in place and working. A good inspection program is an opportunity to find and fix small problems before they become larger ones. Regular worksite inspections along with a system for reporting hazards or unsafe conditions can improve employee communication and morale reduce accidents and incidents and demonstrate Buffalo Trail Public School Division's commitment to the health and safety program.

An inspection is not the same as a workplace hazard assessment, but the two processes are complimentary. A hazard assessment is a process that documents potential hazards that may exist at a worksite while an inspection involves the physical tour of the worksite to document whether hazards identified are being controlled and if any new hazards not previously identified have been made aware of. Reviewing workplace hazard assessments can be helpful in preparing staff for a workplace inspection.

Planned inspections supplement the less formal spot inspections (e.g. field level hazard assessments) that are conducted by staff on a day to day basis as part of their general OHS responsibilities, for example facilities and maintenance where the job tasks change on a day to day basis. Both formal and informal inspections do not replace existing hazard notification system. Hazards must be reported as soon as they are identified. A staff member may be able to correct the hazard immediately (e.g. remove items blocking a fire exit) or additional resources may need to be obtained (e.g. repair of a water leak).

It is essential that school administrators and supervisors participate in the formal inspection process in some way at least twice a year. This is another way to demonstrate the commitment

that East Central Catholic School Division has towards health and safety and as well to motivate staff. Health and safety auditors will look for evidence that this is being done.

This can be achieved by accompanying staff during a formal inspection or just by casually observing the health and safety conditions while doing a worksite walk through.

The hazard rankings of the worksite inspections are categorized as follows:

Immediate Action – An imminent danger situation or conditions/practice that could cause serious injury, permanent disability, loss of life, and/or extensive loss of property or equipment. E.g. guard missing on a table saw, working on the edge of a roof without fall protection, spill of a flammable liquid.

Planned or Scheduled Action – A condition/practice that could cause minor injury or illness, temporary disability and/or property damage that is disruptive but not extensive. E.g. Use of scented products in a classroom, lifting a heavy object without help, using chemicals without proper gloves, MSDS out of date.

When completing formal inspections positive actions will be documented as well. For each corrective action necessary, ensure that someone is assigned to implement the action and a target date is identified. Forward completed checklist to the DU administrator for review and maintain copies in the OHS Documentation Binder at the worksite for at least 3 years.

Protocol for workplace inspections refer to the Safe Work Guideline for Workplace Inspections.
